Latest Version: 6.0

Question: 1

A bank wants its automated regression suite to run automatically whenever developers commit changes to the loan-origination service, so that calculation regressions are caught early. Which practice BEST achieves this continuous regression?

- A. Run the full regression suite manually just once per quarter, after each production release.
- B. Wire the automated regression suite into the CI/CD pipeline so it runs on each build.
- C. Replace the whole regression suite with a single one-time user acceptance sign-off.
- D. Execute the suite only on the tester's own local machine, and only before public holidays.

Answer: B

Question: 2

A compliance requirement states that changes to customer standing data must be attributable to the user who made them.

Which test BEST verifies the logging control behind this requirement?

- A. Confirm the change is saved and displayed correctly on the customer screen.
- B. Check that only administrators are able to view the audit-log screen.
- C. Verify that logs are written to fast storage so they do not slow the transaction.
- D. Make a change as a known user and confirm the log captures who, what, and when.

Answer: D

Question: 3

A tester describes the impact side of a risk for a cross-border settlement feature and lists the consequences the business cares about.

Which factor belongs to the impact dimension of a product risk, rather than its likelihood?

- A. The complexity of the settlement code and the team's unfamiliarity with it
- B. The monetary loss and regulatory penalty if settlement amounts are wrong
- C. The frequency of recent changes to the settlement module
- D. The number of interfaces the module integrates with

Answer: B

Question: 4

After an overnight migration of transaction history from a legacy ledger to a new one, the tester must confirm that no records were lost in transit.

Which check BEST establishes the completeness of the migration?

- A. Reconcile record counts and control totals between source and target
- B. Spot-check a handful of transactions for correct field formatting
- C. Verify that the batch job finished with a success status code
- D. Confirm that the target schema enforces the correct column data types

Answer: A

Question: 5

Two candidate defects surface late in a card-processing release. Defect P mis-formats a rarely used receipt footer; it appears on almost every transaction. Defect Q, seen only under a rare currency-conversion path, silently overcharges customers and would breach conduct rules if shipped.

Which defect should be prioritised for fixing and retesting first, on a risk basis?

- A. Whichever defect is cheaper to fix, to clear the backlog faster
- B. Defect P, because it occurs on almost every card transaction
- C. Defect Q, because its impact is severe despite its rare occurrence
- D. Defect P, because widespread defects always look worse to auditors

Answer: C

Question: 6

Under a data-protection requirement, a customer may request erasure of their personal data where no lawful reason to keep it applies.

Which test BEST verifies the system's handling of such a request?

- A. Delete every customer record outright to prove the erasure function works.
- B. Confirm the personal data is encrypted at rest, since privacy is achieved through encryption.
- C. Verify that a data-erasure button appears on every screen throughout the application.
- D. Submit a valid erasure request and confirm eligible data is erased while retained data stays.

Answer: D

Question: 7

While testing an access-control requirement on a trading desk, a tester finds that an unauthorized role can approve high-value trades.

Beyond the usual defect fields, what should the compliance defect report MOST importantly capture?

- A. A judgment on whether the firm should be sanctioned by the regulator.
- B. The specific compliance requirement violated and the supporting evidence.
- C. A recommended code fix and the exact lines the developer should change.
- D. The measured performance impact of the approval transaction under peak load.

Answer: B

Question: 8

While validating a migrated customer master file, a tester finds that the same real person appears twice, each time under a different customer identifier.

Which data-quality dimension does this defect belong to?

- A. Uniqueness
- B. Timeliness
- C. Consistency
- D. Completeness

Answer: A

Question: 9

With limited time to build an automated regression pack for a trading platform, a tester must decide which existing cases to automate from a large manual suite.

Which basis for selecting cases to automate is MOST appropriate?

- A. Automate whichever cases happen to have the shortest text descriptions in the tool.
- B. Prioritise the highest-risk, frequently rerun cases that add the most protection.
- C. Automate the cases that simply appear alphabetically first in the test-management tool.
- D. Automate only the cases that have never once found a single defect in the past.

Answer: B

Question: 10

A bank wants to be sure its customers can complete a money transfer on the mobile app easily, with minimal confusion and few user errors.

Which non-functional characteristic does this concern MOST directly address?

- A. Portability
- B. Performance efficiency
- C. Reliability
- D. Usability

Answer: D
