Question: 1

A mapping joins a large transaction stream with a smaller customer reference stream by CUSTOMER_ID. Which Joiner design is generally recommended for better performance?

- A. Use the larger stream as master.
- B. Use the smaller stream as master.
- C. Disable the join condition.
- D. Use a Sequence Generator before Joiner.

Answer: B

Question: 2

A mapping must merge rows from three pipelines into one output pipeline. The input groups have matching ports and compatible datatypes. No key-based matching is required. Which transformation should be used?

- A. Union Transformation
- B. Joiner Transformation
- C. Lookup Transformation
- D. Update Strategy Transformation

Answer: A

Question: 3

A mapping must identify the top three customers by revenue within each region. Which configuration is most appropriate?

- A. Rank Transformation with region grouping
- B. Aggregator without group-by ports
- C. Filter with revenue greater than zero
- D. Lookup with persistent cache

Answer: A

Question: 4

A developer wants the database to perform a custom join and apply an optimizer hint before rows enter the mapping pipeline.

Where should this be configured?

- A. Target update override
- B. Workflow link condition
- C. Source Qualifier SQL override
- D. Session recovery setting

Answer: C

Question: 5

Two relational source tables must be joined in one Source Qualifier before data enters the mapping pipeline.

Which condition is generally required?

- A. The tables must be in different repositories.
- B. The tables must use the same database connection.
- C. The target must be a flat file.
- D. The workflow must use a worklet.

Answer: B

Question: 6

A mapping compares incoming product rows with a reference product table and adds CATEGORY_NAME to the pipeline.

Which transformation should be used?

- A. Lookup Transformation
- B. Rank Transformation
- C. Normalizer Transformation
- D. Transaction Control Transformation

Answer: A

Question: 7

A dimension load must insert new rows and make newly inserted lookup values available to later rows in the same session.

Which lookup cache type is most appropriate?

- A. Static cache
- B. Dynamic cache
- C. Uncached lookup
- D. Persistent static cache only

Answer: B

Question: 8

A reference table changes frequently. The session must retrieve the most current value from the database for every incoming row.

Which lookup configuration is most appropriate?

- A. Persistent static cache
- B. Shared static cache
- C. Uncached lookup
- D. Reusable cached lookup

Answer: C

Question: 9

A session uses a persistent lookup cache. The reference table was updated after the cache was created, but the session still returns older lookup values.

What should the developer do?

- A. Rebuild or delete the persistent cache.
- B. Convert the session into a worklet.
- C. Disable all target update statements.
- D. Increase the commit interval only.

Answer: A

Question: 10

An Expression Transformation should call a lookup only when a specific condition is met. The lookup should return a single value to the expression.

Which lookup design is most appropriate?

- A. Connected Lookup Transformation
- B. Unconnected Lookup Transformation
- C. Dynamic connected Lookup only
- D. Persistent cached Lookup only

Answer: B
