## Question: 1

A company is moving to the cloud and wants to enhance the provisioning of compute, storage, security, and networking. Which of the following will be leveraged?

- A. Infrastructure as code
- B. Infrastructure templates
- C. Infrastructure orchestration
- D. Infrastructure automation

**Answer: A**

Explanation:

Infrastructure as code (IaC) is a DevOps practice that uses code to define and deploy infrastructure, such as networks, virtual machines, load balancers, and connection topologies<sup>1</sup>. IaC ensures consistency, repeatability, and scalability of the infrastructure, as well as enables automation and orchestration of the provisioning process<sup>2</sup>. IaC is different from infrastructure templates, which are predefined configurations that can be reused for multiple deployments<sup>3</sup>. Infrastructure orchestration is the process of coordinating multiple automation tasks to achieve a desired state of the infrastructure<sup>4</sup>. Infrastructure automation is the broader term for any technique that uses technology to perform infrastructure tasks without human intervention<sup>5</sup>.

## Question: 2

Which of the following services would restrict connectivity to cloud resources?

- A. Security lists
- B. Firewall
- C. VPN
- D. Intrusion detection system

**Answer: B**

Explanation:

A firewall is a network security device that monitors and controls incoming and outgoing network traffic based on predefined security rules<sup>1</sup>. A firewall can block or allow connection requests to cloud resources based on the source, destination, port, protocol, or content of the packets<sup>2</sup>. A firewall can be deployed as a hardware appliance, a software application, or a cloud service<sup>3</sup>.

### Question: 3

Which of the following cloud characteristics helps transform from a typical capital expenditure model to an operating expenditure model?

- A. Pay-as-you-go
- B. Elasticity
- C. Self-service
- D. Availability

**Answer: A**

Explanation:

Pay-as-you-go is a pricing model in which customers pay only for the resources they consume, such as compute, storage, network, or software services<sup>4</sup>. Pay-as-you-go helps transform from a typical capital expenditure model to an operating expenditure model by eliminating the upfront costs of purchasing and maintaining physical infrastructure and software licenses<sup>5</sup>. Pay-as-you-go also provides flexibility and scalability to adjust the resource consumption according to the changing business needs<sup>6</sup>.

### Question: 4

Which of the following DevOps options is used to integrate with cloud solutions?

- A. Provisioning
- B. API

- C. SOA
- D. Automation

**Answer: B**

Explanation:

API stands for Application Programming Interface, which is a set of rules and protocols that allow different software components or systems to communicate and exchange data. API is used to integrate with cloud solutions because it enables developers to access the cloud services and resources programmatically, without having to deal with the underlying infrastructure or platform details. API also allows for automation, scalability, and interoperability of cloud applications and services.

## Question: 5

A document that outlines the scope of a project, specific deliverables, scheduling, and additional specific details from the client/buyer is called a:

- A. statement of work.
- B. standard operating procedure.
- C. master service document.
- D. service level agreement.

**Answer: A**

Explanation:

A statement of work (SOW) is a document that outlines the scope of a project, specific deliverables, scheduling, and additional specific details from the client/buyer<sup>1</sup>. A SOW defines what the service provider will do for the client and how they will do it, as well as the expected outcomes and quality standards<sup>2</sup>. A SOW is typically used as a supplement to a master service agreement (MSA) or a contract that establishes the general terms and conditions of the business relationship<sup>3</sup>.
